cos = corporates scores

```

1 df = cor.copy()
2 e_type = "cos"           # cis or cos
3 score = "r_score_1"      # name of score
4 base_question = "C2.3"   # question to base score on
5 base_column = 0          # question to base score on
6
7 # select rows and get responses from dataframe
8 data = df.copy().query('question_number == @base_question & column_number == @base_column')
9
10 # provide corresponding question context as variabel and output
11 q_string = print_question(data, base_question, [base_column])
12
13 # calculate scoring
14 response_map = {"No": 1, "Yes" : 5}           # set mapping dictionary
15 data[score] = data.response_answer.map(response_map) # map values to df
16 gob = data.groupby(["account_number", "year"], as_index=False)[score].sum() # group multianswers
17 gob = gob.loc[:, ["account_number", "year", score]] # select relevant columns
18
19 # add score to dataframe
20 cos = pd.merge(left=cos, right=gob, on=["account_number", "year"], how="outer")
21
22 # add explanation to dataframe
23 question = pd.Series(data=[
24     e_type,
25     score,
26     q_string,
27     "1: no inherent risk, 5: inherent risk identified"],
28     index=sex.columns)
29 sex = sex.append(question, ignore_index=True)

```

Risk Scoring

1. Cities

- a. Number of identified hazards
- b. Significant impact of hazards
- c. Current probability of hazards
- d. Current magnitude of hazards

2. Corporates

- a. Inherent risk identified
- b. Risk type mapping
- c. Transitional / physical risk

=> Results as uploaded to GitHub yesterday

D3

Today's Tasks

My Task Schedule

1. Update Risk Scoring / Bugfixing
2. Optional: Create Social or Opportunities Risk Scoring
3. t-SNE approach
